

CloudCorp Engineering Standards - Chapter 1

CloudCorp Global Engineering & Operations Handbook Section 1: Technical Infrastructure, Policies, and Security Standards

1. Infrastructure Operations

All cloud workloads are partitioned across multi-region availability zones.
Automated failover monitors detect node failures within 500 milliseconds and trigger DNS rerouting.
Persistent storage volumes utilize AES-256 block-level encryption with quarterly key rotation.
Every engineer must ensure that service configurations adhere strictly to SOC 2 Type II controls.

2. Network Architecture & Egress

Direct connect gateways link on-premise data centers to virtual private clouds.
Ingress traffic passes through redundant web application firewalls and DDoS mitigation layers.
Rate limiting is enforced at 5,000 requests per minute with automated client notification.

3. Monitoring & Incident Handling

Telemetry collectors sample metrics every 10 seconds and report to centralized time-series stores.
Severity 1 incidents trigger automated PagerDuty escalation to on-call commanders within 60 seconds.
Post-mortem analysis documents must be completed and shared with stakeholders within 5 business days.

Automated failover monitors detect node failures within 500 milliseconds and trigger DNS rerouting.

Persistent storage volumes utilize AES-256 block-level encryption with quarterly key rotation.

Every engineer must ensure that service configurations adhere strictly to SOC 2 Type II controls.

2. Network Architecture & Egress

Direct connect gateways link on-premise data centers to virtual private clouds.

Ingress traffic passes through redundant web application firewalls and DDoS mitigation layers.

Rate limiting is enforced at 5,000 requests per minute with automated client notification.

3. Monitoring & Incident Handling

Telemetry collectors sample metrics every 10 seconds and report to centralized time-series stores.

Severity 1 incidents trigger automated PagerDuty escalation to on-call commanders within 60 seconds.

Post-mortem analysis documents must be completed and shared with stakeholders within 5 business days.

CloudCorp Engineering Standards - Chapter 18

CloudCorp Global Engineering & Operations Handbook

Section 18: Technical Infrastructure, Policies, and Security Standards

1. Infrastructure Operations

All cloud workloads are partitioned across multi-region availability zones.

Automated failover monitors detect node failures within 500 milliseconds and trigger DNS rerouting.

Persistent storage volumes utilize AES-256 block-level encryption with quarterly key rotation.

Every engineer must ensure that service configurations adhere strictly to SOC 2 Type II controls.

2. Network Architecture & Egress

Direct connect gateways link on-premise data centers to virtual private clouds.

Ingress traffic passes through redundant web application firewalls and DDoS mitigation layers.

Rate limiting is enforced at 5,000 requests per minute with automated client notification.

3. Monitoring & Incident Handling

Telemetry collectors sample metrics every 10 seconds and report to centralized time-series stores.

Severity 1 incidents trigger automated PagerDuty escalation to on-call commanders within 60 seconds.

Post-mortem analysis documents must be completed and shared with stakeholders within 5 business days.

Automated failover monitors detect node failures within 500 milliseconds and trigger DNS rerouting.

Persistent storage volumes utilize AES-256 block-level encryption with quarterly key rotation.

Every engineer must ensure that service configurations adhere strictly to SOC 2 Type II controls.

2. Network Architecture & Egress

Direct connect gateways link on-premise data centers to virtual private clouds.

Ingress traffic passes through redundant web application firewalls and DDoS mitigation layers.

Rate limiting is enforced at 5,000 requests per minute with automated client notification.

3. Monitoring & Incident Handling

Telemetry collectors sample metrics every 10 seconds and report to centralized time-series stores.

Severity 1 incidents trigger automated PagerDuty escalation to on-call commanders within 60 seconds.

Post-mortem analysis documents must be completed and shared with stakeholders within 5 business days.

CloudCorp Global Engineering & Operations Handbook

Section 34: Technical Infrastructure, Policies, and Security Standards

1. Infrastructure Operations

All cloud workloads are partitioned across multi-region availability zones.

Automated failover monitors detect node failures within 500 milliseconds and trigger DNS rerouting.

Persistent storage volumes utilize AES-256 block-level encryption with quarterly key rotation.

Every engineer must ensure that service configurations adhere strictly to SOC 2 Type II controls.

2. Network Architecture & Egress

Direct connect gateways link on-premise data centers to virtual private clouds.

Ingress traffic passes through redundant web application firewalls and DDoS mitigation layers.

Rate limiting is enforced at 5,000 requests per minute with automated client notification.

3. Monitoring & Incident Handling

Telemetry collectors sample metrics every 10 seconds and report to centralized time-series stores.

Severity 1 incidents trigger automated PagerDuty escalation to on-call commanders within 60 seconds.

Post-mortem analysis documents must be completed and shared with stakeholders within 5 business days.

Persistent storage volumes utilize AES-256 block-level encryption with quarterly key rotation.

Every engineer must ensure that service configurations adhere strictly to SOC 2 Type II controls.

2. Network Architecture & Egress

Direct connect gateways link on-premise data centers to virtual private clouds.

Ingress traffic passes through redundant web application firewalls and DDoS mitigation layers.

Rate limiting is enforced at 5,000 requests per minute with automated client notification.

3. Monitoring & Incident Handling

Telemetry collectors sample metrics every 10 seconds and report to centralized time-series stores.

Severity 1 incidents trigger automated PagerDuty escalation to on-call commanders within 60 seconds.

Post-mortem analysis documents must be completed and shared with stakeholders within 5 business days.

CloudCorp Engineering Standards - Chapter 51

CloudCorp Global Engineering & Operations Handbook

Section 51: Technical Infrastructure, Policies, and Security Standards

1. Infrastructure Operations

All cloud workloads are partitioned across multi-region availability zones.

Automated failover monitors detect node failures within 500 milliseconds and trigger DNS rerouting.

Persistent storage volumes utilize AES-256 block-level encryption with quarterly key rotation.

Every engineer must ensure that service configurations adhere strictly to SOC 2 Type II controls.

2. Network Architecture & Egress

Direct connect gateways link on-premise data centers to virtual private clouds.

Ingress traffic passes through redundant web application firewalls and DDoS mitigation layers.

Rate limiting is enforced at 5,000 requests per minute with automated client notification.

3. Monitoring & Incident Handling

Telemetry collectors sample metrics every 10 seconds and report to centralized time-series stores.

Severity 1 incidents trigger automated PagerDuty escalation to on-call commanders within 60 seconds.

Post-mortem analysis documents must be completed and shared with stakeholders within 5 business days.

Every engineer must ensure that service configurations adhere strictly to SOC 2 Type II controls.

2. Network Architecture & Egress

Direct connect gateways link on-premise data centers to virtual private clouds.

Ingress traffic passes through redundant web application firewalls and DDoS mitigation layers.

Rate limiting is enforced at 5,000 requests per minute with automated client notification.

3. Monitoring & Incident Handling

Telemetry collectors sample metrics every 10 seconds and report to centralized time-series stores.

Severity 1 incidents trigger automated PagerDuty escalation to on-call commanders within 60 seconds.

Post-mortem analysis documents must be completed and shared with stakeholders within 5 business days.

CloudCorp Global Engineering & Operations Handbook

Section 67: Technical Infrastructure, Policies, and Security Standards

1. Infrastructure Operations

All cloud workloads are partitioned across multi-region availability zones.

Automated failover monitors detect node failures within 500 milliseconds and trigger DNS rerouting.

Persistent storage volumes utilize AES-256 block-level encryption with quarterly key rotation.

Every engineer must ensure that service configurations adhere strictly to SOC 2 Type II controls.

2. Network Architecture & Egress

Direct connect gateways link on-premise data centers to virtual private clouds.

Ingress traffic passes through redundant web application firewalls and DDoS mitigation layers.

Rate limiting is enforced at 5,000 requests per minute with automated client notification.

3. Monitoring & Incident Handling

Telemetry collectors sample metrics every 10 seconds and report to centralized time-series stores.

Severity 1 incidents trigger automated PagerDuty escalation to on-call commanders within 60 seconds.

Post-mortem analysis documents must be completed and shared with stakeholders within 5 business days.

2. Network Architecture & Egress

Direct connect gateways link on-premise data centers to virtual private clouds.

Ingress traffic passes through redundant web application firewalls and DDoS mitigation layers.

Rate limiting is enforced at 5,000 requests per minute with automated client notification.

3. Monitoring & Incident Handling

Telemetry collectors sample metrics every 10 seconds and report to centralized time-series stores.

Severity 1 incidents trigger automated PagerDuty escalation to on-call commanders within 60 seconds.

Post-mortem analysis documents must be completed and shared with stakeholders within 5 business days.

CloudCorp Engineering Standards - Chapter 84

CloudCorp Global Engineering & Operations Handbook

Section 84: Technical Infrastructure, Policies, and Security Standards

1. Infrastructure Operations

All cloud workloads are partitioned across multi-region availability zones.

Automated failover monitors detect node failures within 500 milliseconds and trigger DNS rerouting.

Persistent storage volumes utilize AES-256 block-level encryption with quarterly key rotation.

Every engineer must ensure that service configurations adhere strictly to SOC 2 Type II controls.

2. Network Architecture & Egress

Direct connect gateways link on-premise data centers to virtual private clouds.

Ingress traffic passes through redundant web application firewalls and DDoS mitigation layers.

Rate limiting is enforced at 5,000 requests per minute with automated client notification.

3. Monitoring & Incident Handling

Telemetry collectors sample metrics every 10 seconds and report to centralized time-series stores.

Severity 1 incidents trigger automated PagerDuty escalation to on-call commanders within 60 seconds.

Post-mortem analysis documents must be completed and shared with stakeholders within 5 business days.
